

The time series above displays the change over time in the global total number of deaths by nutritional deficiencies between the years 1990 and 2019. The value for each year was calculated by summing over the values for all countries that year. As can be seen, apart from some temporary local increases, the global total number of deaths by nutritional deficiencies experiences a big and strong general decrease over time from 1990 to 2020, from more than 4,000,000 to less than 1,500,000. This cannot be attributed to time directly cause-wise, and has to be further investigated in order to determine the cause, making it an interesting trend observed.
